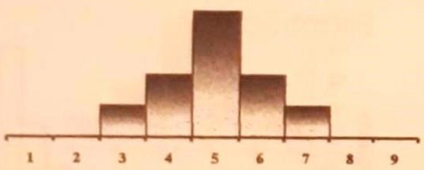
Interpreting Shapes, Centers, and Spreads

Comparing Distributions:
When you compare two or more data sets, focus on four features:

- ★ Graphically, the center of a distribution is the point where about half of the observations are on either side.
- ★ The ~~variation~~ spread of a distribution refers to the variability of the data. If the observations cover a wide range, the spread is larger. If the observations are clustered around a single value, the spread is smaller.
- ★ The shape of a distribution is described by symmetry, skewness, number of peaks, etc.
- ★ Unusual Features: refer to gaps (areas of the distribution where there are no observations) and outliers.

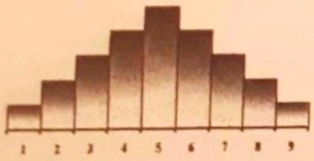
SPREAD
The spread of a distribution refers to the variability of the data. If the data cluster around a single central value, the spread is smaller. The further the observations fall from the center, the greater the spread or variability of the set.



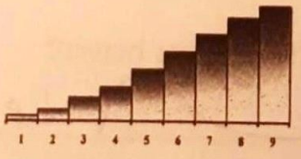
1. Less Variable

2. More Variable

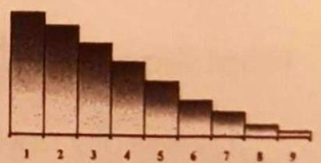
SHAPE
The shape of a distribution is described by symmetry, number of peaks, direction of skew, or uniformity



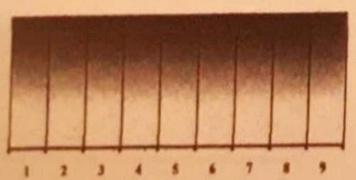
3. Symmetric/Normal



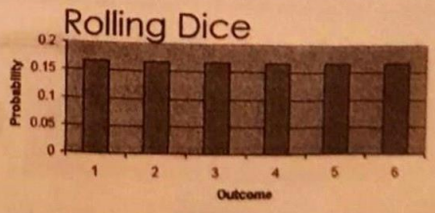
4. Left Skewed

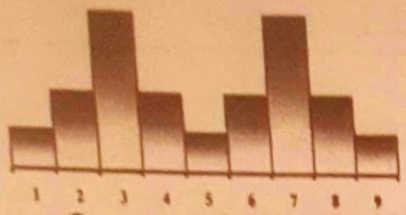


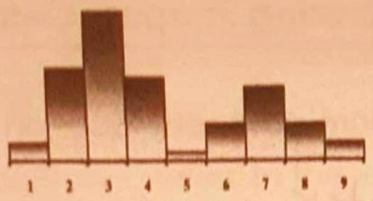
5. Right Skewed

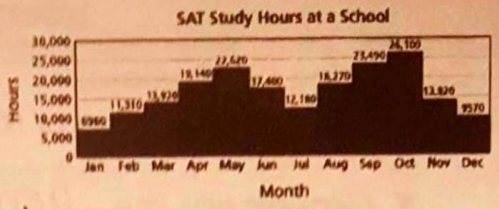


6. Uniform







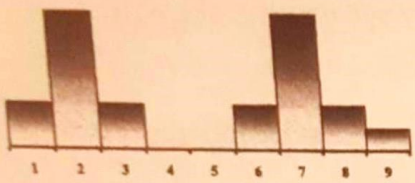


7. Bimodal Symmetric

8. Bimodal, Nonsymmetric

UNUSUAL FEATURES

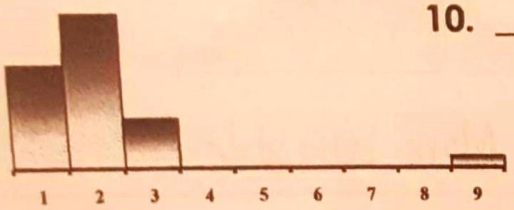
Sometimes, statisticians refer to unusual features in a set of data. The two most common unusual features are gaps and outliers.



9. Gap

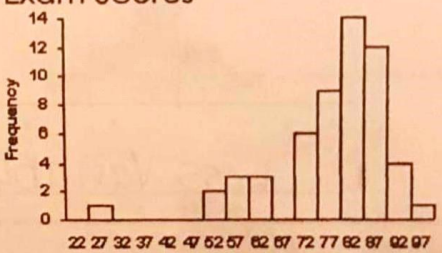
Kentucky Derby Times

What could have caused this shift in times?



10. Outlier

Exam Scores



Practice Problems:

What shape would the following situations have?

1) A really hard test  Left

2) A really easy test  Right

3) Results of rolling a 6 sided die 1000 times  Uniform

4) Heights of student ~~at Hillgrove?~~ Northpaulding Symmetry

5) Heights of NBA players? Left Skewed
